

A Comparison Of Proximal Femoral Nail Antirotation And

As recognized, adventure as with ease as experience very nearly lesson, amusement, as without difficulty as promise can be gotten by just checking out a book **a comparison of proximal femoral nail antirotation and** along with it is not directly done, you could admit even more in this area this life, roughly the world.

We meet the expense of you this proper as competently as simple habit to get those all. We meet the expense of a comparison of proximal femoral nail antirotation and and numerous ebook collections from fictions to scientific research in any way. among them is this a comparison of proximal femoral nail antirotation and that can be your partner.

These plates provide greater stability than other plates because they are locking and allow for the placement of screws at different angles. 13 In our study, a biomechanical comparison of the locking proximal anatomic femoral plate and the proximal femoral intramedullary nail was performed to determine the ideal implant for use in the unstable intertrochanteric fracture model. The synthetic bone models used were third-generation femur models with properties similar to natural human bone.

Background: To compare the efficacy of three-point locating versus routine locating techniques for implanting helical blades for proximal femoral nail anti-rotation-II in the treatment of trochanteric fractures. Methods: From January 2010 to June 2013, 90 patients with intertrochanteric fractures were surgically treated, including 48 males and 42 females with an average age of 70.5 ± 7.2 years.

~~Comparison of two methods of locating proximal femoral...~~

connecting line of the femoral condyle and the horizontal line was measured at the distal end of the femur, and the angle between the femoral neck and the horizontal plane was measured at the proximal end of the femur. The difference between these two angles is the femoral neck ante-version (FNA), which is $9.3+6.68=15.98^\circ$ (Fig. 1d, e).

Objective: To compare the effects of proximal femoral nail antirotation blade (PFNA) and reverse less invasive stabilization system?distal femur (Liss?DF) systems in the treatment of proximal femoral fractures. Methods: Between June 2007 and October 2009, 41 proximal femoral fractures were treated, 22 with PFNA (group A) and 19 with reverse LISS?DF plates (group B).

Aim and Objective- To compare outcome of intertrochanteric femur fractures treated with DHS and PFN. Methodology: comparative study of proximal femoral nail and dynamic hip screw in the treatment of 50 cases of intertrochanteric femur fractures in the Department of orthopedics, DY Patil Hospital Pune was done from July 2015 to July 2016.

~~Comparison of PFN (Proximal femoral nail) and DHS (Dynamic...~~

Objective: To compare the effectiveness of proximal femoral nail antirotation (PFNA) and reconstruction nail with minimally invasive technique for ipsilateral femoral shaft and extracapsular hip fractures in young and middle-aged patients. Methods: Sixty-nine young and middle-aged patients with ipsilateral femoral shaft and extracapsular hip fractures were treated between January 2000 and August 2010, and their data were analyzed retrospectively.

for the comparison protocol. The mesh of this generic proximal femur was constituted from 11,442 points. From this generic object, different anatomic regions were defined: the femoral head, superior and inferior femoral neck, greater trochanter, lesser trochanter, and medial, lateral, anterior and posterior diaphyses (Figure 1).

~~3D reconstruction of the proximal femur with low dose ...~~

A meta-analysis to assess the pros and cons of proximal femoral nail anti-rotation (PFNA) versus InterTAN nail for intertrochanteric femoral fractures including available evidence extracted from literature. According to the Cochrane systemic analysis method, randomized control trials (RCTs) and retrospective comparative observational studies which were related to the comparison of PFNA and ...

~~Comparison of clinical outcomes with proximal femoral nail ...~~

Abstract. The objective of this study comparing the proximal femoral nails Targon PF (Aesculap, Tuttlingen, Germany) and Proximal Femoral Nail Antirotation (PFNA; Synthes, Oberdorf, Switzerland) was to observe the complications and postoperative results following pertrochanteric femoral fracture fixation, with special attention devoted to the dynamic properties of both implants under physiological load in vivo.

~~The dynamics of proximal femoral nails: a clinical ...~~

We have several lessons learned in the last 10 years according to the surgery of unstable proximal femur fracture type 31A2.2–31A3.3 according the AO/OTA classification: short interval from injury to surgery is a positive factor; cephalo-medullary nails in different lengths and cerclages for unstable (sub-)trochanteric fractures are better for early mobilization in some fracture-types and ...

~~Focus on proximal femur fractures: surgical options and ...~~

Abstract. The goal of this study was to compare the results of proximal femoral nail antirotation (PFNA; Synthes, Oberdorf, Switzerland) fixation with those of Gamma nail 3 (GN-3; Stryker, Mahwah, New Jersey) fixation for unstable proximal femoral fractures. A total of 136 unstable trochanteric fractures were divided into 2 treatment groups: 66 patients were treated with the PFNA and 70 were treated with the GN-3.

The aim of this study was to compare two proximal femur nails with regard to the complication rate and midterm clinical outcome : the InterTAN nail (ITN) versus the third generation gamma nail (GN). 78 patients older than 60 years with an unstable intertrochanteric femoral fracture (AO/OTA 31 A2/A3) were randomised over a 20 month period into either ITN (n = 39) or GN (n = 39).

Comparison of clinical outcomes with proximal femoral nail anti-rotation versus InterTAN nail for intertrochanteric femoral fractures: a meta-analysis. J Orthop Surg Res. 2020; 15(1):500 (ISSN: 1749-799X)

~~Comparison of clinical outcomes with proximal femoral nail ...~~

Objective: The purpose of this study is to compare a cephalomedullary nail that uses a piriformis fossa starting point to one that uses a trochanteric starting point, in the treatment of high-energy proximal femur fractures in young patients. Our hypothesis was that a nail that uses a trochanteric starting point would result in less blood loss than a nail that uses a piriformis fossa starting ...
