No two lizard species have spawned as much folklore, wonder, and myth as the Gila Monster, *Heloderma suspectum*, and the Beaded Lizard, *H. horridum* the sole survivors of an ancient group of predacious lizards called the Monstersauria. More like snakes on legs, monstersaurs are a walking contradiction: they are venomous yet don't appear to use their venom for subduing prey; their mottled patterns mingle with the broken shadows and textures of their desert and tropical dry forest habitats ...

Amazon.com: Biology of Gila Monsters and Beaded Lizards ...

Gila monster, (*Heloderma suspectum*), one of two species of North American venomous lizards in the genus *Heloderma* of the family Helodermatidae. The Gila monster (*H.*

These snakes typically are diurnal, wide-foraging generalists and ingest prey headfirst. Twenty-nine percent of 447 diet items were mammals, 29% were snakes, 25% were lizards, 11% were birds, 4% ...

(PDF) Biology of Gila Monsters and Beaded Lizards, Chapter ...

Its name comes from the Gila River, where the lizards are common. Gila monsters are desert dwellers, living near washes and arroyos and in semiarid rocky regions of desert scrub or grasslands. Gila monsters also seem to prefer rocky foothills and avoid open flats and agricultural areas. They can live at elevations up to 5,000 feet (1,500 meters).

Gila monster | Smithsonian's National Zoo

Gila Monster By Laura Allard and Dr. Frey Biology and Identification The gila monster (pronounced ' Hee-la '), *Heloderma suspectum*, is a slow-moving species of venomous lizard found within Utah, specifically in the Southwestern corner of Washington County, near where Utah meets both Arizona and Nevada. This is the northern extent of their distribution, which stretches from Sinaloa, Mexico to Washington County, Utah and from SW New Mexico to the Colorado River.

Gila monsters can use water to cool off too. They can lose water across their “leaky” skin, or they can expose moist tissue to help cool down. The end of the digestive tract in reptiles and birds is called the “cloaca.” Gila monsters can actually expose part of the membranes that make up the cloaca to the outside.

Gila Monster Water Saving Strategies | Ask A Biologist

What might such a monster set of data do for us if it was about our very own North American monster – the Gila monster? Computational biologist Melissa Wilson Sayres tells Dr. Biology about the Gila monster, the life-saving venom in its saliva, and what we might learn from the monster genome.

Biology of Gila Monsters and Beaded lizards (Book). University of California Press, Berkeley. Beck, D. D. 2004. *Venomous Lizards of the Desert*.

Dr. Daniel D. Beck | Central Washington University

A black-and-orange lizard native to the southwestern United States and Mexico, Gila monsters have venomous saliva. There’s a peptide in the venom that’s used to treat type 2 diabetes. “We’d like to understand what the peptide is doing in the monsters and then can better understand how it works in humans,” Wilson said.

Computational Biologist Melissa Wilson on Sex Chromosomes ...

The Gila Monster Lizard (*Heloderma suspectum*) poisonous, but scientists have created a new drug from its saliva that helps control diabetes. They are indigenous to the Sonoran desert of southwestern Arizona and northwestern Mexico
Drugs from gila monster lizard saliva reduces cravings for chocolate and ordinary food

Gila Monster - Scientific

An adult Gila Monster is unmistakable. In addition to being large, they are stocky with a broad, thick head and short (<56% of SVL), thick tail. Large, elongated venom glands are located under each side of the lower jaw and these lizards possess grooved teeth for delivery of venom.
