Future Aircraft Power Systems- Integration Challenges

Integrated Power Systems for Future Transport Aircraft. 971247. This paper describes and discusses ways to improve future transport aircraft through integration within the power generation, distribution and utilization elements of the secondary power systems. Integration of hardware and functions along with power management and selection of a common single type of secondary power distribution is shown to offer advantages in cost, weight, fuel efficiency and reliability for the future ...

Power and Thermal Management for Future Aircraft

Power systems that are highly integrated on the aircraft level may reduce fuel burn, but the possible gain is estimated to be less than items (1) and (2), so a power system research project is not recommended as a high priority. While not called out explicitly, simulation and modeling improvement are important to all three of these projects.

2004-01-3204. General thermodynamic analytical investigations on the primary components of aircraft power systems, as well as vehicle integration and mission considerations, have revealed that thermal management plays a key role in limiting payload size and performance. All power system components such as batteries, capacitors, power semiconductors, generators, pulsed power sources and beam conditioners have thermal design issues when their performance is pushed to deliver higher powers.

April 17, 2015 Omid Orfany Management. The trend in modern aircraft design is away from mechanical systems (hydraulics, pneumatics, etc.) and toward electrical components, or Aircraft Electrical Power Distribution Systems. There are several benefits of the modern design (particularly weight savings). However, as with any airplane design, no system can be fielded before it can be proven safe, reliable, and able to be maintained over the aircraft's life.

Introduction to aircraft electrical power distribution systems

Future aircraft and the airspace systems, however, will increasingly rely on "cyber" advances, particularly, in network and information technologies. We envision that "cyber-physical" integration is central to the design and performance of these future aviation information systems. We propose a Cyber-Physical System (CPS) abstraction as a missing framework for future aviation information systems.
