In mathematics, a partial differential equation is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 - 3x + 2 = 0$. However, it is usually impossible to write down explicit formulas for solutions of partial differential equations. There is, correspondingly, a vast ...

The book gathers, revises and explains in depth the newly developed Adomian decomposition method along with its modification, and some traditional techniques. The linear and the nonlinear partial differential equations are handled by new and traditional approaches to show that the new method handles these equations at a level accessible to anyone without any need to use abstract and compact theorems.

Partial differential equations (PDEs) of hyperbolic/nearly hyperbolic type are of fundamental importance in many areas of applied mathematics and engineering, particularly for applications arising in fluid dynamics and electromagnetics. Typically, solutions to these types of equations exhibit localized phenomena, such as propagating discontinuities and sharp transition layers, and their reliable numerical approximation represents a challenging computational task.

In mathematics a partial differential algebraic equation (PDAE) set is an incomplete system of partial differential equations that is closed with a set of algebraic equations. The Fokas method, or unified transform, is an algorithmic procedure for analysing boundary value problems for linear partial differential equations and for an important class of nonlinear PDEs belonging to the so-called integrable systems.

The above equation is a partial differential equation (PDE), which is a differential equation that contains unknown multivariable functions (e.g., a function of space and time $U(x, t)$ or a function of multiple spatial coordinates $U(x, \mathbf{y})$) and their partial derivatives (e.g. derivative to time and derivative to a spatial coordinate).

Ordinary differential equations are much more understood and are easier to solve than partial differential equations, equations relating functions of more than one variable. We do not solve partial differential equations in this article because the methods for solving these types of equations are most often specific to the equation.
