In Python, all variables are expected to be defined before use. The None object is a value you often assign to signify that you have no real value for a variable, as in: try: x except NameError: x = None. Then it's easy to test whether a variable is bound to None: if x is None: some_fallback_operation() else: some_operation(x)

Python is a widely used high-level, general-purpose, interpreted, dynamic programming language. Its design philosophy emphasizes code readability, and its syntax allows programmers to express concepts in fewer lines of code than would be possible in languages such as C++ or Java. The language provides constructs intended to enable clear programs on both a small and [...]
