

Stochastic Fuzzy Differential Equations With An Application

When somebody should go to the books stores, search commencement by shop, shelf by shelf, it is in point of fact problematic. This is why we allow the ebook compilations in this website. It will utterly ease you to see guide stochastic fuzzy differential equations with an application as you such as.

By searching the title, publisher, or authors of guide you truly want, you can discover them rapidly. In the house, workplace, or perhaps in your method can be every best place within net connections. If you object to download and install the stochastic fuzzy differential equations with an application, it is categorically simple then, previously currently we extend the connect to purchase and make bargains to download and install stochastic fuzzy differential equations with an application appropriately simple!

STOCHASTIC FUZZY DIFFERENTIAL EQUATIONS WITH AN APPLICATION

In this paper we present the existence and uniqueness of solutions to the stochastic fuzzy differential equations driven by Brownian motion. The continuous dependence on initial condition and stability properties are also established. As an example of application we use some stochastic fuzzy differential equation in a model of population dynamics.

We write the stochastic fuzzy differential equations with delay (stochastic fuzzy functional differential equations) in their symbolic form as follows: (4.1) $dx(t) = \int_P f(t, x(t)) dt + \int_P g(t, x(t)) dB(t)$, $x(0) = P$. 1 , where $x(t)$ denotes the value of the fuzzy stochastic process x at the instant t , and $x(t) = \{x(t + \tau)\}$ $[-\tau, 0]$ could be considered as a C , S -valued stochastic process.

We define stochastic differential equations with fuzzy set coefficients and prove that their solutions are random fuzzy set processes. This is achieved by obtaining almost sure boundedness of solutions to stochastic differential equations with set coefficients.

On Stochastic Differential Equations with Fuzzy Set ...

The topic of fuzzy stochastic differential equations with solutions that are the fuzzy stochastic processes with continuous sample paths is very new and its foundations are contained in . Such equations generalize both the deterministic fuzzy differential equations and the crisp stochastic differential equations . They join together some features of each kind of mentioned equations to offer a mathematical apparatus appropriate in description of dynamic systems evolving in fuzzy and ...

First aim of the paper is to present a survey of possible approaches for the study of fuzzy stochastic differential or integral equations. They are stochastic counterparts of classical approaches known from the theory of deterministic fuzzy differential equations. For our aims we present first a notion of fuzzy stochastic integral with a semimartingale integrator and its main properties. Next we focus on different approaches for fuzzy stochastic differential equations.

We study fuzzy stochastic differential equations driven by multidimensional Brownian motion with solutions of decreasing fuzziness. The drift and diffusion coefficients are random. Under a non-Lipschitz condition, the existence and pathwise uniqueness of solutions to such the equations are proven.

important, stochastic differential equations is given by $dX(t) = X(t)dt + \sigma(X(t))dB(t)$ with $X(0) = x_0 > 0$; where $1 < \sigma < 1$ and $\sigma > 0$ are constants. Let us pretend that we do not know the solution and suppose that we seek a solution of the form $X(t) = f(t; B(t))$. For this candidate, we have $f'(t) = \sigma dX$

such a requirement is met. Symmetric fuzzy stochastic differential equations $x(t) = \int_0^t f(s, x(s))ds + \int_0^t g(s, x(s))dB(s) = x_0 + \int_0^t f(s, x(s))ds + \int_0^t g(s, x(s))dB(s)$, $t \in [0, T]$ are such equations. They are also the first fundamental step towards possibility of future research on periodic solutions of fuzzy stochastic differential equations.

A stochastic differential equation (SDE) is a differential equation in which one or more of the terms is a stochastic process, resulting in a solution which is also a stochastic process. SDEs are used to model various phenomena such as unstable stock prices or physical systems subject to thermal fluctuations. Typically, SDEs contain a variable which represents random white noise calculated as the derivative of Brownian motion or the Wiener process. However, other types of random behaviour are possible.

In the chapter, the author considers an approach used in the studies of stochastic fuzzy differential equations. These equations are new mathematical tools for modeling uncertain dynamical systems. Some qualitative properties of their solutions such as existence and uniqueness are recalled, and stability properties are shown.

(c.) A \mathbb{R} -valued stochastic process $(M_t)_{t \in I}$ indexed by I is a supermartingale with respect to $\{\mathcal{F}_t\}_{t \in I}$ if the stochastic process $(-M_t)_{t \in I}$ is a submartingale. That is, if (i) For every $t \in I$, $E[M_{t+1} - M_t] \leq 0$. (ii) For every $t \in I$, M_t is \mathcal{F}_t -measurable. (iii) For every $s < t \in I$, $E[M_t | \mathcal{F}_s] \leq M_s$.
