**The 2009 Influenza Pandemic - GOV.UK**

The 2009 H1N1 virus, called swine flu because the virus likely originated in pigs and contained genes from multiple strains of swine influenza viruses, first broke out in Mexico and subsequently spread to the United States and other countries around the world.

**Influenza A H1N1 | virus | Britannica**

In virology, influenza A virus subtype H1N1 is a subtype of Influenza A virus. Well known outbreaks of H1N1 strains in humans include the 2009 swine flu pandemic, as well as the 1918 flu pandemic. It is an orthomyxovirus that contains the glycoproteins haemagglutinin and neuraminidase. For this reason, they are described as H1N1, H1N2 etc. depending on the type of H or N antigens they express with metabolic synergy. Hemagglutinin causes red blood cells to clump together and binds the virus to th

**Influenza A virus subtype H1N1 - Wikipedia**

The 2009 flu pandemic vaccines were influenza vaccines developed to protect against the pandemic H1N1/09 virus. These vaccines either contained inactivated (killed) influenza virus, or weakened live virus that could not cause influenza. The killed vaccine was injected, while the live vaccine was given as a nasal spray.

**2009 swine flu pandemic vaccine - Wikipedia**
